Average Revenue: Promo vs Non-Promo

Promotional Revenue by Customer Tier

Diagnostic Finding: Hypothesis testing (Welch's t-test) revealed that revenue during promotional periods was statistically significantly lower (£129.90 average) than non-promotional periods (£299.22 average). Furthermore, 67.2% of promotional revenue came from customers already in the top RFM tier (Champions), meaning promotions are subsidizing loyal customers rather than reactivating at-risk ones.

Business Recommendations

Reallocate Promotional Spend

Finding

- 67.2% of promotional revenue came from **Champions**, indicating discounts primarily rewarded customers who were already likely to purchase.

Recommendation

- Redirect promotional budgets toward **At Risk** and **Lost** customers.
- Use personalized offers to generate incremental sales instead of subsidizing existing loyal customers.

Optimize Discount Strategy

Finding

- Welch's t-test showed that promotional periods generated significantly lower average revenue (£129.90) than non-promotional periods (£299.22), suggesting deep discounts reduced profitability.

Recommendation

- Reduce blanket discounting.
- Test smaller, targeted promotions and optimize discount depth to protect margins.

Strengthen Customer Retention

Finding

- Cohort analysis shows customer retention declines sharply during the first few months after acquisition.

Recommendation

- Launch automated retention campaigns before expected churn periods.
- Encourage repeat purchases through personalized follow-up offers and loyalty
